84. (a)

An investment grows to \$6000 after 5 years at 6% p.a. compounded annually. It then continues to grow at a different rate of $s\%$ p.a. compounded annually, reaching \$7200 after a further 3 years.

Find the value of s , correct to 3 significant figures.

$$6000\left(1 + \frac{s}{100}\right)^3 = 7200 \quad (M1)$$

$$\left(1 + \frac{s}{100}\right)^3 = 1.2 \quad \mathbf{A1}$$

$$1 + \frac{s}{100} = 1.2^{\frac{1}{3}} \quad (M1)$$

$$s \approx 6.27 \quad \mathbf{A1}$$
